

## week 7 task 1

There are many reasons for ignoring safety concerns in medical equipment and automotive industry, and in other products. New products are constantly released in a fast rate and if companies find success with every product they release without any safety complications, then the company might overlook safety concerns since incidents haven't happened and they might think it won't happen in the future.

Human error is also a natural part of making products and humans might overlook safety concerns for several reasons like thinking they are not serious etc. Overlooking the safety concerns might also be related to budgeting and costs. A company might value costs over safety and overlook the critical safety concerns just to prevent extra costs. Furthermore, time might also be a huge factor since companies usually have deadlines for products and that might lead to overlooking safety concerns since it saves time. There is also a possibility of companies and people not being aware of security concerns.

Incidents and accidents related to the products that ignored safety concerns are usually the most common factor for companies and people making a sudden change regarding safety concerns. For example, tesla autopilot has caused several crashes and that might make tesla consider the safety concerns more, also the introduction of new technologies might make companies re-evaluate the safety concerns.
